

QDP FORK INTAKE FORM

Complete before any new branch, model term, observable shift, or platform claim is opened.

1. BRANCH IDENTIFICATION

Date:

Requestor:

Branch / Model Tag:

Change Type: ☐ Hamiltonian term ☐ free parameter ☐ observable ☐ integrator
☐ platform ☐ scale-bridge

Classification: ☐ formal core ☐ example ☐ interpretation

Likely bath class: ☐ Markovian reservoir ☐ kernel memory ☐ metastable C-state ☐ TLS ☐ QP ☐ phonon ☐ vortex ☐ EM/Purcell ☐ other

2. SCOPE LOCK

Primary observable (required):

Secondary observable (required):

Accessible platform / device class:

Minimal discriminant measurement:

Any cross-scale claim? ☐ no ☐ yes -> effective mapping attached

3. CONSTRAINTS

Invariant that must remain preserved:

Known limit / reduction limit that must be recovered:

New free parameters (#):

Independent constraint source for each parameter:

4. FALSIFIABILITY

Exact falsifier / kill condition:

Does this increase falsifiable surface area? ☐ yes ☐ no

Relevant nuisance / artifact controls listed? ☐ yes ☐ no

Bath classification consistent with glossary? ☐ yes ☐ no

5. VALIDATION LADDER

L0 baseline reproduced? ☐ yes ☐ no

L1 reduction limit passed? ☐ yes ☐ no

L2 convergence plan defined? ☐ yes ☐ no

L3 stability criterion defined? ☐ yes ☐ no

L4 instrument-facing comparison path defined? ☐ yes ☐ no

6. AUTOMATIC FLAGS

☐ >2 unconstrained new parameters -> SANDBOX ONLY

☐ missing primary or secondary observable -> DEFER / REJECT

☐ no exact falsifier -> DEFER

☐ no known limit -> REJECT

☐ scale claim without mapping -> REJECT

7. OUTCOME

Recommended outcome: ☐ Proceed ☐ Sandbox only ☐ Defer ☐ Reject

Reviewer / date:

Notes:

PROMOTION RULES

A branch may not escalate unless it preserves invariants, recovers a known limit, declares one primary and one secondary observable, registers an exact falsifier, and clears the validation ladder in order. If the fork adds more than two new unconstrained parameters at once, default outcome is Sandbox only.
